### INTRODUCTION

The man's story about the misses is the story of a progressive rupture between the man and the surroundings (SAINTS, 1998). As Munford (1998), in the evolution of the process of domestication and group interaction, the man left marks in caves, in the Paleolithic eras. The need for food and protection joined the religious awe and the predisposition to social conviviality, making emerge the campsites, sanctuaries and villages.

The natural landscape and its components, to Tropmair (2001), are obstacles to be overcome and the civilized man creates a "second nature", that second Munford (1998), is characterized by an ambivalent character, combining the friendly cohabitation with the segregation of classes, divine and spiritual protection with lack of affective sentiment, the ample freedom with greater violence.

These contradictions are present in urban culture and also served as stimuli for its development. Urbanization brings quantitative and qualitative changes. The urban environment is an increasingly artificial means, "manufactured" with remnants of nature increasingly cloaked by the works of man.

As Santos (1998), the cultural landscape replaced the natural landscape. Urban growth, under the aegis of the capitalist economy, meant an institution publishes the service of particular interest, with the destruction of all the natural characteristics.

At the beginning of the 20th century, the International Congress of modern architecture (CIAM), have become forums for discussions about urbanism. In Greece, in 1920, Le Corbusier States that cities should meet the following requirements: live, work and recreate. Plans and utopian attempts have proliferated in Europe and in the United States, in an attempt to improve the quality of urban life.

According to Santos and Malik (2002) Historically, the concept of quality of life emerges in the years 60. Prevailed, so a chain essentially economist who analyzed the amount of growth evolution of their GDP. This measure, corresponding to the amount of goods and services generated and being thus an indicator of wealth and distributed, translated from global economic growth way verified, but not contemplated several fundamental aspects that would analyze the development of a society.

So we can address the function of public squares in the urban environment, it is necessary, we also urban quality of life. The squares as public space, play important roles in the urban environment, including the integration of the community and the improvement of environmental quality. The advantages of a good planning of urban and rural green areas are based on contributions to the improvement of aesthetic and environmental aspects of the urban environment, mitigating the impacts caused the population and the environment, as a result of this development.

Today, it is observed that the squares are no longer enjoyed as in times past. Formerly, they were the center of political events and the religious festivities, civic and social acts. On the weekends, residents of urban and rural areas they ACE squares, because there was fun, leisure of other eras, the meetings, the first of many stories and the end of many others.

Second Angelis and Angelis Neto (2000), with the emergence of other forms of leisure alternatives and new locations for the establishment of trade, associated with the persistent disregard of the public power against maintenance of squares that in the case of Campo Grande-MS is the responsibility of the Municipal Government, these began to build in an extra fragment within the urban fabric.

Over time the changes came and the squares were no longer a priority recreation space. Currently, most people have other needs and feel the world around you differently. This does not mean that the urban green spaces need to fall by the wayside, because they are ecologically important, have aesthetic values and assist in reducing thermal amplitude, and new uses can be extended to them with proper equipment. Instigating new forms of perception of the urban environment, it would be possible to extend the positive relations of the population with the landscape. The appreciation for green spaces could be rescued, even if people no longer use them the way you did before. Two points must not be forgotten: the constant participation and awareness of the public authorities (DEMATTE and PEGOLO, 2002).

The importance of green areas to the urban environment is very expressive, that have as main objective to preserve the environment as well as improving the urban landscape. In addition, another important function is the generation of leisure.

Thus, the objective of this work is carried out an analysis of the current situation of sports square Belmar Fidalgo, located in Campo Grande-MS, to evaluate their characteristics and uses.

### Belmar Plaza Hidalgo

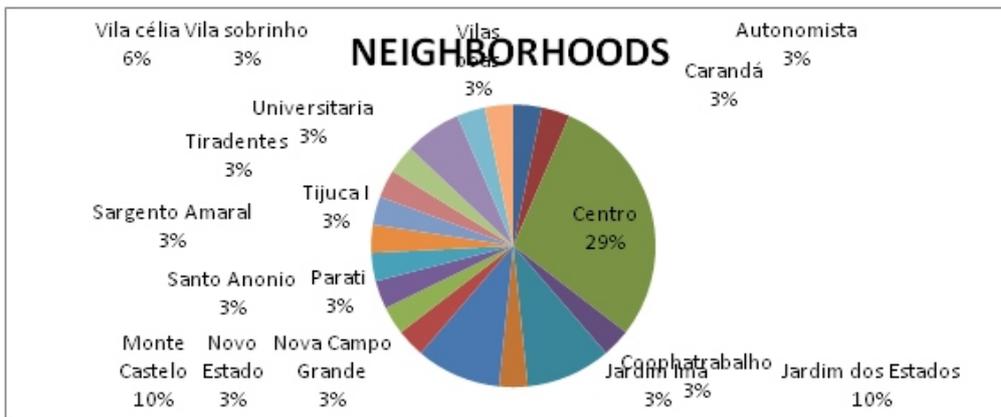

On Sports square Belmar fidalgo there are two sports courts, arena for sand courts, jogging track, bathrooms, showers, Swiss soccer field, playground, gym, cafeteria, administrative offices, very green and a strong lighting.

UNIMED responsible for cleaning and maintenance of the entire green area, offering employees coming from a service provider. Daily to UNIMED maintains nursing team in outpost providing service to users of the square. Are the provision of security, three municipal guards serving in 12:0 am shifts system. Sixteen servers and 5 physical education teachers that provide guidance to the user continuously.

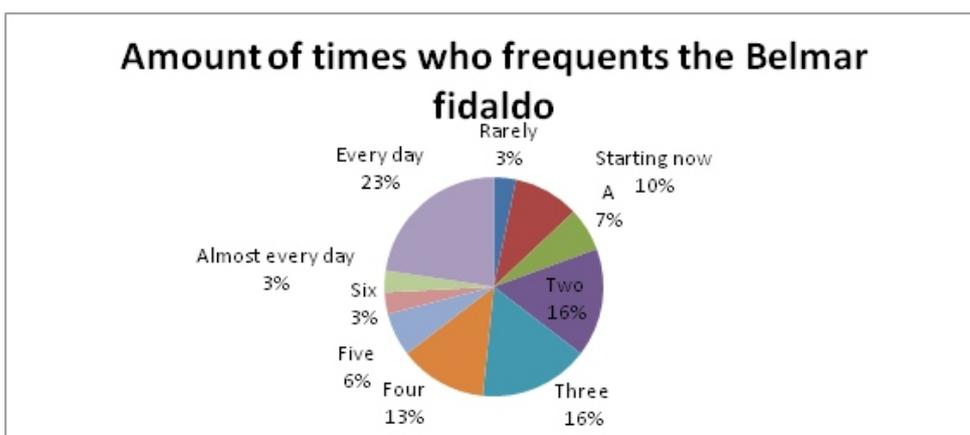

### METHODOLOGY

The work was to perform a search With the population that frequents the Park to detect what leads people to frequent it. The survey was conducted directly with the respondent, who responded to a standardized questionnaire with 5 open questions, performed with 31 people of both sexes, in 18 districts of the city.

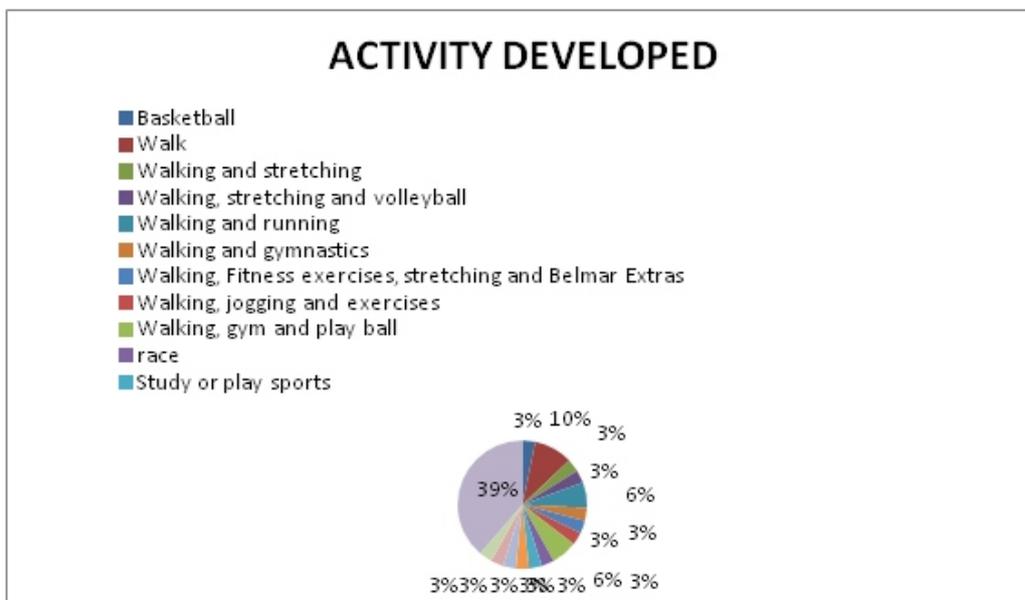

**RESULTS AND DISCUSSION**

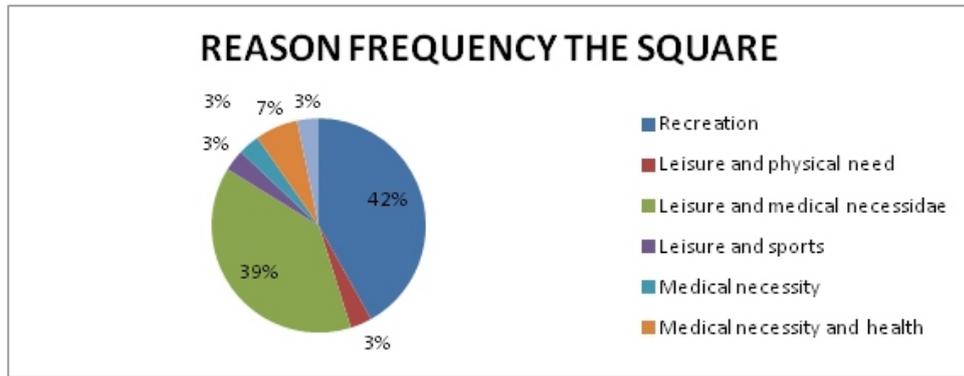

We note that the Belmar Fidalgo is used by people of varied neighborhoods of Campo Grande, seen that we detected 18 different neighborhoods.

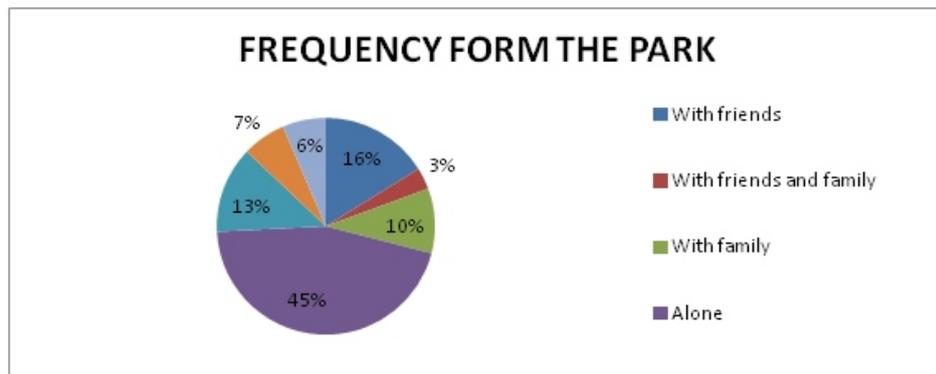

We find that most people attending the Belmar Fidalgo between three and seven days a week. It meets medical recommendations which they say is ideal for improving health physical activities at least three times a week.

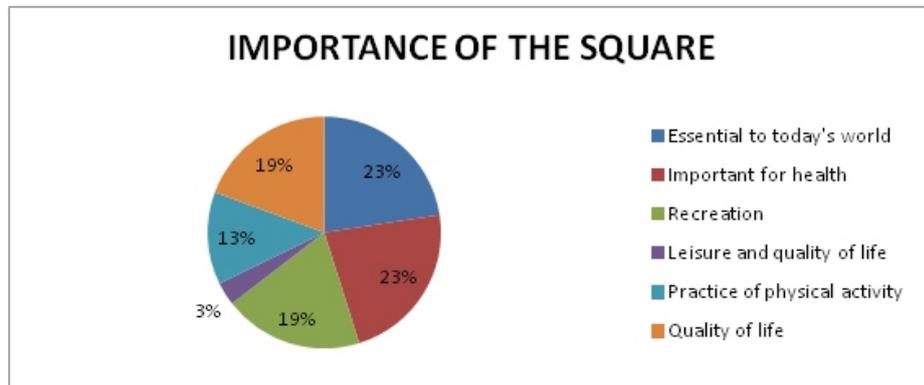

We can observe that the hike is more activity performed. We believe that this result is directly connected to the media which in turn performs an important role in the awareness of the population.

This question shows us that the trend of modern medicine, is to seek disease prevention through the Association of physical activities to conventional treatments.

We have here a great social indicator, where increasingly people are isolating. On the other hand we have the squares with a form of socialization.

We observe that the square of the Belmar Fidalgo has complied with its role, which is to provide the population leisure, physical activity, quality of life in the urban environment.

**CONCLUSION**

The dynamics and the development of cities and the capacity to ensure their sustainability resula, today, if we want to, the ability of different agents – politicians, public and private entities, civil society, to manage these different qualities with the goal of providing a better quality of life.

We realize that the Brazilian landscape turned to Futurism thinking this will lead us to a growth and devaluing the past. This devaluation makes the appreciation and respect for the environment and heritage.

In this respect, the squares have contributed to respect for the environment and heritage, as well as assist in the control of solar radiation, air humidity and wind action; thus easing air pollution. it is therefore of fundamental importance the community involvement (and individuals) in the drawing process of public spaces seeking an ecological urbanism as references to conservation of natural resources since these act directly in control of the urban climate. What we perceive is a construct of nature built on squares we can confirm if the square of the Belmar Fidalgo.
