INTRODUCTION

Cancer is a group of diseases that have in common the uncontrolled growth of malignant cells that invade tissues and organs and can spread to other parts of the body, changing its name to metastasis (INCA, 2009).

In Brazil, the cancer is considered a public health problem. Breast cancer, along with cancer of the uterus, gets attention of national health policy, the high incidence of morbidity and mortality. Currently, cancer is the third cause of death in the Brazilian male population, after cardiovascular diseases and external causes (BRASIL, 2011). Between women and men over 40 years old, the disease constitutes the second cause death, surpassed only by cardiovascular disease (BRITO, 2005).

According to Brazil data (2014) from the mid-80 has been growing public policy being driven by "live program woman" their goals were: the fight against breast cancer in line with the guidelines of the national policy on prevention and control cancer – Pt 874/13. These guidelines in 2011 according to INCA been updated and defined in the establishing Law n°12.40-2011 clinical documents in character, reaffirming a priority on the issues of prevention, diagnosis and treatment.

Breast tumor can be: invasive, also dominated cancer in situ, it is one breast, without spread to other organs and there is no disruption of the lining of the tumor, so the cancer cells are has the potential to become invasive (PINHEIRO, 2013).

In the female population, breast cancer is the most common and is the leading cause of death among cancers in the world (BIM, 2010).

The Ministry of Health (2013), points breast cancer as a major death of women, there is a high investment in broadcasting prevention methods and guidance and health education for the public and health professionals know what the major factors are risk, thereby enhancing the promotion of health in primary and secondary sectors, breast cancer are associated with age factors, lifestyle and food, life history, genetic mutation (BRCA1 e BRCA2) still in Brazil most of the tumors are malignant and are detected at advanced stages and by the woman herself.

The prioritization of prevention strategies such as the collection of cervical cancer screening, self-examination, clinical examination, screening (mammography) detection and early diagnosis of breast cancer to reduce the morbidity and mortality rates (SILVA, 2011).

Breast cancer can affect males at a ratio of 1:100 women, according to Haas (2009) is incidence is increasing in younger men because the lifestyle and need not detect.

Breast cancer is the major cause of death in the world an Brazilian women, according to the National Cancer Institute INCA (2014) the expected estimate for the year 2014 for Brazil are 57.120 new cases of breast cancer, with estimated risk of 56,09 cases per 100.000 women. Excluding the non-melanoma skin tumors this is more common in women in the Southeast (71,18 / 100.000).

Breast cancer is classified into four stages, from 0 to 4. Depending on the extent of the disease: Stage 0: cancer cells are contained in the ducts, so usually curable; stage 1: tumor < 2 cm without the armpit lymph node involvement; stage 3: nodule with more than 5 cm, reaching neighboring structure, with muscle and skin, glands lymph, but still no signs of metastasis; stage 4: are tumor of any size with metastases usually with lymph node involvement, in Brazil, 60 to 70% of cases are diagnosed at stage 3 or 4 (FRAZÃO, 2013).

The Guarulhos Municipality has as a preventive campaign in October rose by the Ministry of Health this month is indicative help lecture, and a intensification largest in the collection of cervical cancer screening and self-examination in the (UBS) basic health units.

MATERIALS AND METHODS

It's a study of epidemiological, descriptive, cross-sectional, quantitative approach. The approach method used was deductive. The research was conducted in the municipality of Guarulhos, São Paulo. Fieldwork was conducted by the authors in daytime. The study was composed of residents of male and female in the municipality of Guarulhos in 2015, age 40-70 years who agreed to participate and to sign the commitment agreement in this research. The research were excluded those who don't fit the inclusion criteria and those that are experiencing cognitive or difficulty in understanding changes. Once established and clarified the objects were given a folder with educational information about the prevention of breast cancer. For data collection was used a questionnaire with two parts, the first part of demographic and clinical profile partner and the second part on data on research. After the questionnaires, data were expressed in graphics.

OBJECTIVES

Check what are the preventive and educational actions against existing breast cancer in Guarulhos, and what services are offered to the public.

RESULTS

Graph 1: Distribution percentages with respect to age, marital status and educational level of residents in the municipality Guarulhos, S.P. 2015.

Graph 2: Distribution percentages with respect to frequency behavior to a Basic Health Unit (UBS) of residents in the municipality of Guarulhos, S.P. 2015.

Graph 3: Distribution percentages with respect to ways to detect breast cancer, knowledge of self-examination and frequency that carries out self-examination, the residents of the municipality of Guarulhos, S.P. 2015.

Graph 4: Distribution percentages with respect to the knowledge of prevention of breast cancer, the examination by professional, receiving information about breast cancer in the past two years and where he was received information, the residents of the municipality of Guarulhos, S.P. 2015.

Graph 5: Distribution percentages with respect to guidance on prevention, services offered by the municipality, providing the health service and use of consultations, the residents in the municipality of Guarulhos, S.P. 2015.

CONCLUSION

It follows that, in the group studied, the majority of respondents know detect and know the self-examination and breast cancer prevention activities in the Health Unit.

After analyzing the data, it was found that most respondents received about breast cancer information in the last two years and received are media for guidance; the female respondents received guidance from a health care professional about prevention of breast cancer since no male respondent received guidance.

Most are unaware of the services offered by the municipality related to the prevention of breast cancer, and most have easy access to services offered by the municipality and use service for medical consultation.

Breast cancer in men also has a low incidence, but has showed increasing values. For its low prevalence has been rarely viewed as subject of study, therefore, this study finds it difficult to access assets for the same.

Health education, carried out individually or collectively by health professionals, leads the individual to a new consciousness and transforms it into an active agent of the care process, standing on their toes in the mirror and your conscience a twist to the fighting there breast cancer and its complications.

This study was an exhilarating experience and very rewarding for our personal, professional and academic development, showing the importance of self-examination breasts of independent, of sex and for planning interventions that disease and change the attitude of the population in the prevention and detection early breast cancer.
